"Mocks aren't Stubs"

A **mock** is a kind of **test double**. Other kinds of test doubles include **stubs, fakes, spies, dummies**.

The difference between different "schools" of TDD, is how you use test doubles.

"Mocks aren't Stubs"

A **mock** is a kind of **test double**. Other kinds of test doubles include **stubs, fakes, spies, dummies**.

The difference between different "schools" of TDD, is how you use test doubles.

Option: Patch a Mock

```python
from unittest.mock import patch, call
from my_module import total_value

def test_total_value():
    with patch('my_module.db_read') as mock_read:
        mock_read.return_value = [100, 200]

        assert 300. == total_value("karl@python.de", 92)
        assert [call("karl@python.de", inv_no=92)] == mock_read.calls
```
